

JOSHUA EJIOTIH

Software Engineer

Lagos, Nigeria | +234 703 286 6779 | joshuaejiotih@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Pulled a client's entire database out of a platform with no export feature at all, by directing its built in AI tooling to generate the one tool that could do the job, then running the migration myself under a locked down admin session, moving forty five production tables into a new, fully client owned environment. Also found and closed a privilege escalation gap in that same platform's access control. Software Engineer focused on frontend development with experience building production web applications across healthcare, UK immigration compliance, and community platforms, comfortable moving between frontend architecture, authentication systems, and AI integration, with backend and system design as the next stretch of that range.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript

Frontend: React, Tailwind CSS, Responsive Design, Component Architecture, Figma (design handoff and review)

Backend & Cloud: Supabase, Firebase, REST APIs, Edge Functions, Vercel, Cloudflare

AI Integration: Gemini API, Prompt Engineering, AI-assisted Image Analysis

Practices: Authentication, Role-Based Access Control, Database Migrations, Observability and Logging, Technical Documentation

Tools: Git, GitHub, APIs (Email APIs, Speech APIs, Voice APIs), Google Workspace, Microsoft Office

PROFESSIONAL EXPERIENCE

Frontend Engineer (Intern)

April 2025 – June 2026

Bincom Dev Center, Lagos, Nigeria

Contributed to four client software products across healthcare, UK immigration compliance, and community engagement, building two from the ground up within a cross-functional team, and produced the PRDs, backend specifications, and handover documentation behind each.

FoodRisk AI

React, TypeScript, Supabase, Gemini API

Built from scratch. An AI powered platform that helps people catch food risks and allergens before they eat, not after.

- Replaced a failing OCR pipeline with Gemini powered image understanding once traditional OCR proved too unreliable for real food labels.
- Built a key rotation system that kept AI features running through quota limits, switching between Gemini keys automatically instead of dropping requests.
- Built the admin and Super Admin dashboards from the ground up, including audit logs and error tracking that gave the team visibility into failures they simply couldn't see before.

Sponsor Compliance System

React, TypeScript, Supabase, Cloudflare

A compliance platform used by UK licensed sponsors to track workforce and immigration requirements, where a mistake in access control has real regulatory consequences.

- Pulled the platform's entire database out of a system with no export feature at all, by directing its built in AI tooling to generate the one tool that could do the job, then running the migration myself under a locked down admin session, moving forty five production tables into a new, fully client owned environment.
- Found a privilege escalation flaw in the platform's access control and rebuilt the permission checks at the layer where they actually needed to sit.
- Built the centralized activity and error logging that gave the team visibility into production issues for the first time.

Spirit Connect

React, JavaScript, Cloudflare, Resend, Speechmatics

Built from scratch. A guided prayer and journaling platform where the hardest problem wasn't the backend, it was getting an automated audio session to behave the same way on an iPhone as it did on a desktop browser.

- Resolved cross-device audio inconsistencies in automated prayer sessions through repeated testing and iteration with the client, standardizing timing and playback behavior across browsers and mobile operating systems, and built the testimony and prayer library administration behind it.

Facilitator
Bincom Academy, Lagos, Nigeria

August 2025 – May 2026

- Facilitated web development training for more than one hundred learners across multiple cohorts, teaching JavaScript, TypeScript, React, Git, and deployment fundamentals, and mentored students individually through project-based learning.

Industrial Trainee
Opex Academy

May 2023 – August 2023

- Built mobile applications using Flutter and Dart within a structured team development environment, the starting point of a path into frontend and production engineering.

EDUCATION

B.Sc. Computer Science
University of Nigeria, Nsukka

March 2024

Research Project: Receipt Genius, a receipt generation application for SMEs, built in Flutter.
